

How to care contact lenses

It's important for you to care your contact lens in the correct way.

Why do we need contact lens care?

When wearing contact lens, tear such as protein, fat, calcium, and stains such as cosmetics adhere to the lens. If you leave these stains as they are:

- ✚ Haze and cloudiness make it difficult to see
- ✚ The feeling of wearing become worse
- ✚ Causes eye damage

Please read the instruction manual carefully and take properly care.

Types of soft contact lens care

In addition of dirt, soft contact lenses can grow germs are mold due to the nature of the lens. Therefore, if it necessary to clean and disinfect.

① **MPS (Multipurpose solution)**

You can clean, disinfect, and store the lens with just one lens. It is cleaned and sterilized by scrubbing to disinfect the germs that remain during lens storage.

② **Hydrogen peroxide type**

Since it is cleaned and disinfected by the power of hydrogen peroxide, there is no deterioration of the lens due to heat. In addition, a high disinfecting effect can be expected. Recommended for those who are concerned about rough hands and those who are liable to damage the lens.

③ **Boil disinfection**

After scrubbing with solution, heat to disinfect. Although the disinfecting effect is very high, heat may deteriorate the lens. Depending on the type of lens, boiling disinfection may not be possible.

✘ Currently, we do not handle special care products.

Types of hard contact lens care

① Liquid type 1

A type that can clean, store, and remove proteins with a single lens.
Removes dirt by the power of enzymes.

② Liquid type 2

This type uses a combination of a cleaning and preservative solution that removes dirt from the lens and an enzyme solution that decomposes proteins and other substances that adhere to the lens.

③ Scrub cleaner

Cleans with the cleaning solution and the physical force of your fingers.
There are types with and without abrasives.

※ Please note that some types of contact lenses cannot be used with abrasive cleaners.
